Title (English) Increased neuropsychiatric morbidity among non-heterosexual individuals: A study of 25,000 20-47 year-old twins			
Title (Swedish)			
Abstract This study is one of the world's largest analyses of the increased neuropsychiatric morbidity among non-heterosexual individuals. Not only did we elaborate on earlier research by finding increased rates of distress/depression, AD/HD and obsessive compulsive disorder, we also showed that while this could partly be explained by the minority stress hypothesis, there also appears to be some familial factors connecting non-heterosexuality to increased mental illness.			
Keywords Non-heterosexual, neuropsychiatry, mental health, twin design, sexual orientation
