Title (English) Affinity and capacity studies in two different test systems for human IgE		
Abstract <p>The clinical diagnostics company Phadia AB develops and sells two <i>in vitro</i> allergy test platforms, ImmunoCAP[®] System and ImmunoCAP[®] Rapid. The test systems are principally very similar but differ in many practical aspects. Therefore, the aim of this study was to investigate and compare the capacity of these two test systems to bind specific antibodies and to see how the test results were affected by the antibody's binding affinity to the antigen.</p>		
Keywords <p>Immunoassays, Human Immunoglobulin E, Antibody affinity</p>
